

Patient Instructions for Care after Eye Injection

1. Call our office immediately at **800-331-6634** if your vision suddenly worsens or you experience pain. After hours this number will connect you with our 24/7 answering service.
2. Many patients have a “scratchy” or “sandy” sensation in their eye following the injection. Artificial tear drops or gel can be used to soothe the eye. It is important to avoid rubbing the eye.
3. A red spot or area of blood on the white of the eye at the injection site may occur. This usually resolves within two weeks or so.
4. New floaters on the day after the injection are common and should subside within days. They should not worsen over time. If so, call the office promptly.
5. A small bubble may appear in the bottom of your vision (visible as a round dark spot or circle that moves along with the eye or head) and should disappear within 48 hours.
6. No swimming for 4 days and avoid getting tap water to the eye (shut tightly when showering).
7. Keep your next appointment as scheduled.
